

**Topic:** Implement a fast, typo-tolerant FAQ chatbot using **Typesense** for natural language queries.

**Description:** This FAQ Chatbot is a user-friendly application that leverages Typesense for advanced search capabilities, enabling it to provide accurate and context-aware responses to user queries. It is particularly useful for answering common questions about Apple products, such as return policies and device updates, with a focus on delivering quick and precise information. The chatbot's typo tolerance and semantic understanding ensure a smooth user experience, even for those who may not phrase their questions perfectly.

## How Typesense and application works:

1. **Data Preparation and Indexing:**
  - a. FAQ data (questions, answers, and metadata) is stored in a JSON file or database.
  - b. The JSON data is indexed into a **Typesense collection** with a predefined schema. The schema includes fields like question, answer, tags, and optional metadata to optimize search relevance.
2. **Semantic and Typo-Tolerant Search in Typesense:**
  - a. **Typesense** processes natural language queries with typo tolerance, fuzzy matching, and semantic relevance.
  - b. Queries are tokenized and matched against the indexed data, with scoring mechanisms that prioritize results based on relevance, even if there are typos or slight mismatches in the input.

## Some sample questions and answers:

FAQ Chatbot

 Hello! How can I help you today?

How can I buy Apple products?

 You can purchase Apple products through multiple channels:

- Apple Store (online at [apple.com](https://apple.com))
- Apple retail stores
- Authorized Apple resellers
- Major electronics retailers

For the best experience and authentic products, we recommend purchasing directly from Apple's official channels or authorized resellers.
